

1. OVERVIEW

Subject area	Mechanics and Waves I
Degree	Bachelor's Degree in Physics
School/Faculty	Architecture, Engineering and Design
Year	2º
ECTS	6
Туре	Compulsory
Language(s)	Spanish
Delivery mode	On campus
Semester	1º

2. INTRODUCTION

The main aim of this subject area is for students to build a solid understanding of the core aspects of classical mechanics in its more theoretical formalism. The subject area is designed for students to become familiar with and incorporate into their work the scientific methodology and procedures inherent to the subject. Through analysis and summary, plus critical thinking, students will gain a good understanding of the logical and mathematical structure of the most important physical theories.

Mechanics and Waves I deepens and broadens the knowledge acquired in the subject area Fundamentals of Physics I. The subject Mechanics, and its formalism, aims to establish the principles of classical mechanics that form the basis of subject areas in later years of the degree. It provides a useful foundation for a better and more in-depth understanding of the subjects studied later in the programme, such as: Experimental Project I, Statistical Physics, Experimental Project II, Quantum Mechanics I and II, Nuclear and Particle Physics. Relativistic Mechanics.

It expands on Newtonian mechanics in kinematics and particle dynamics and systems of particles. It explores dynamics in more complex problems, central-force problems in planetary motion, analysing different types of orbits. It links Newtonian mechanics to the new formalism and procedures of Lagrangian and Hamiltonian mechanics. It introduces the variational formalism that, along with the stationary-action principle, provides an introduction to classical field theories, and lays the foundations for subsequent subject areas in modern physics, such as Quantum Mechanics, Particle Physics, Quantum Field Theory, etc. Lastly, it explores small oscillations around equilibrium points in linear and non-linear systems.

The aim is for students to be able to identify, model, propose and resolve situations that involve these aspects of mechanics and their application in solving problems inherent to the subject. Students will become familiar with the scientific method by completing research-based

problems and exercises. Students will also learn to interpret mechanical systems and their theoretical modelling, learning to apply different problem-solving strategies using the formalisms of different theoretical structures and forming relevant conclusions. They will be able to identify similarities in the mathematical formulation of different problems, applying known procedures or solutions to new problems.

3. SKILLS AND LEARNING OUTCOMES

Basic skills and general skills (CB and CG, respectively, by their acronym in Spanish):

- **CB1**. Students have shown their knowledge and understanding of a study area originating from general secondary school education, and are usually at the level where, with the support of more advanced textbooks, they may also demonstrate awareness of the latest developments in their field of study.
- **CB4.** Students can communicate information, ideas, problems and solutions to both specialist and non-specialist audiences.
- **CG1**. To understand key concepts, methods and findings in the different branches of physics while gaining a historical perspective of their development.

Transversal skills (CT, by the acronym in Spanish):

- CT4. Written communication/Oral communication: Ability to communicate and gather information, ideas, opinions and viewpoints in order to understand and be able to act upon them, whether they are through spoken word and gestures, or through written word and/or visual aids.
- CT5. Problem solving: Be able to critically evaluate information, separate complex situations into their constituent parts, recognise patterns, and consider alternatives, different approaches and perspectives in order to find optimal solutions and negotiate efficiently.

Specific skills (CE, by the acronym in Spanish):

- **CE2**. To describe and analyse physical systems, identifying fundamental concepts and principles to make the approximations needed to build a simplified model.
- CE3. To understand the inherent limitations of classical physics that led to the emergence of the general and special theories of relativity and quantum mechanics, resulting in solutions to new physics problems.
- **CE4**. To understand the laws and principles of physics, to identify their logical and mathematical structure, their experimental basis and the phenomena described through them.
- **CE5**. To understand and know how to use the mathematical and numerical methods used in physics and in handling experimental data.

Learning outcomes (RA, by the acronym in Spanish):

- **RA1**. To correctly apply Newtonian, Lagrangian and Hamiltonian formulations to solve mechanical problems, including, in particular, the study of small oscillations around equilibrium points.
- **RA2.** To correctly use the mathematical formulation of classical mechanics in the practical study of mechanical systems in motion.

• **RA3.** To connect the symmetries and conservation laws in physics, using them to complete practical exercises.

The following table shows how the skills developed in the subject area match up with the intended learning outcomes:

Skills	Learning outcomes
CB1, CB4, CG1, CT4, CT5, CE2, CE3, CE4, CE5	RA1. To correctly apply Newtonian, Lagrangian and Hamiltonian formulations to solve mechanical problems, including, in particular, the study of small oscillations around equilibrium points.
CB1, CB4, CG1, CE2, CE4, CE5	RA2. To correctly use the mathematical formulation of Classical Mechanics in the practical study of mechanical systems in motion.
CT5, CE2, CE3, CE4	RA3. To connect the symmetries and conservation laws in physics, using them to complete practical exercises.

4. CONTENTS

This subject is organised into five learning units or topics.

1. Newtonian mechanics.

Point kinematics. Inertial frames of reference and Galilean relativity. Newton's laws for single particles and systems of particles. Constants of motion. Work and energy. Linear momentum and angular momentum. One-dimensional potentials.

2. The two-body problem. Central forces.

Reduction to the equivalent one-body problem. Equations of motion. Constants of motion. The Kepler problem. Scattering in a central force field.

3. Lagrangian mechanics.

Generalised coordinates. Holonomic constraints in a mechanical system. Generalised coordinates and configuration space. Euler–Lagrange equations. Hamilton's principle. Constants of motion. Lagrange multipliers. Symmetry and conservation. Cyclic coordinates.

4. Hamiltonian mechanics.

Introduction to the Hamiltonian formulation. Hamilton's equations. Dynamical systems and phase diagrams. Hamilton's equations. Symmetries, conserved quantities.

5. Small oscillations.

Simple harmonic oscillator. Damped oscillator. Forced oscillator and resonance. Introduction and definitions. Normal modes of oscillation. Normal frequencies. Amplitudes of the modes. Normal coordinates. Generalisation of a linear system. Small oscillations in non-linear systems.

5. TEACHING/LEARNING METHODS

The types of teaching/learning methods are as follows:

- **Lectures**: Presentations by the professor with the necessary technological tools to maximise comprehension of the learning content.
- Collaborative learning: Students complete collaborative activities to find creative, comprehensive and
 constructive solutions to questions and problems that arise from the given case studies, using all
 relevant knowledge and material resources available.
- **Problem-based learning**: Students are given problems and asked to solve them, working individually or in groups.
- **Guided academic activities:** Individual and group work that is more independent, including information searches, written summaries and public defence of projects.

6. LEARNING ACTIVITIES

The types of learning activities, plus the amount of time spent on each activity, are as follows:

On campus:

Learning activity	Number of hours
Lectures	37
Oral presentations of projects	7.5
Report writing	7.5
Assessment	6
Practical activities (problems, projects, lab work)	21.5
Tutorials	16
Independent working	54.5
TOTAL	150

7. ASSESSMENT

The assessment systems, plus their weighting in the final grade for the subject area, are as follows:

On campus:

Assessment system	Weighting
Knowledge tests (assessment system 1 or SE1) Individual on-campus knowledge tests (theory and/or practice). Students will take a compulsory midterm exam, which accounts for 10% of the final grade. The final exam on the full content of the subject area has a weighting of 40% (minimum grade 4). The final exam can compensate for and improve the grade for the midterm exam.	50%
Submission of group and/or individual exercises (SE2) Submission of group and/or individual reports, written work, projects or exercises. Exercises will be planned for individual or group submission that complement or reinforce the subject area content.	35%
Oral defence (SE3) Students will give group or individual presentations on a subject topic or research problem. The aim is to expand on or clarify a specific concept or procedure from the syllabus.	5%
Performance observation (SE4) This is a subjective grade that is based on attendance, participation in class, collaboration with classmates and respect for others in the classroom. This grade will only be awarded if the student has attended over 50% of the classes, whether on campus or online during class hours.	10%

On the Virtual Campus, when you open the subject area, you'll find details of your assessable tasks, including the submission dates and assessment procedures for each task.
